

*With power outages becoming an all too common occurrence, a Conquest Wildman UPS is the ideal solution to protect your IT infrastructure*

- *Protects hardware from damaging electricity spikes*
- *Enables an automatic, safe shutdown of your server*
- *Time to save valuable work during a power failure*
- *Avoid corruption of your important data*
- *Compact space saving design*

## **IN DETAIL** ● ● ●

A Conquest Wildman Uninterruptible Power Supply solution is the best way to protect your critical equipment from power failure and spikes in the electricity supply. Blackouts not only cause major inconveniences but are also the second largest cause of hardware damage.

When mains electric fails our UPS solution instantaneously switches over to battery power, so your computer or server continues to run unaffected, even whilst the mains electricity is off. If a power cut continues for a long period of time, the UPS will continue to provide power for the system until its internal batteries start to run low. Our solution can then send a signal to the computer or server telling it to initiate a shutdown procedure – giving users enough time to save their work, but more importantly, ensuring the server is powered down properly. This is especially important as incorrect shutdowns can cause data corruption. When the mains power is restored, the UPS will automatically come back online and start to charge its batteries in readiness for the next power failure.

In addition to providing a battery backup, a Conquest Wildman UPS also provides mains filtering, helping ensure that your equipment is not damaged by sudden spikes or surges on the mains. But it's not just your server and workstations that can benefit from UPS protection. Other business critical equipment, such as your telephone system and data storage devices can be protected too.

**A Conquest Wildman UPS solution can be tailored to provide protection for a single workstation, right through to an entire organisation.**
